

# Are optical modules independently controllable

## Overview

This paradigm is called “host independent management”, enabling advanced capabilities of smart optical modules via additional management methods. With the goal of promoting worldwide compatibility of optical networking products, the OIF actively supports and extends the work of national and international. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Operating at the physical layer of the OSI model, optical modules are core devices in optical. For example, the module can work as 1 x 400GBASE-DR4 (8 electrical tracks and 4 optical tracks), but also as 4 x 100GBASE-DR independent of each other (2 electrical tracks; 1 optical track). The vastness of these possibilities has led to the introduction of the concept of the so-called Data Path. Industry pundits have recently speculated that demand for 100G/400G switches may take off in 2019, prompting optical transceiver module vendors to sample data center switches with high data transmission rates earlier than expected. As data center operators accelerate upgrades in preparation for 5G.
