

# Busbar on top of high voltage switch

## Overview

A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. It connects the incoming power to circuit breakers and outgoing circuits, helping power flow smoothly and evenly. Good busbar design helps prevent overheating and electrical. Among them, the small busbar at the top of the high-voltage cabinet, although small in size, plays a crucial role. Typical busbar applications include switchgear, panel boards. Busbar design in switchgear ensures safe, reliable power distribution by balancing current capacity, thermal performance, mechanical strength, insulation, and standards compliance. Busbars provide a safe HV connection on shorter distances. An insulated high voltage bus bar for use in densely populated high voltage power supplies.
