

## Cold aisle rack-mounted servers for intelligent computing centers

### Overview

Cold aisle containment systems use doors at aisle ends, ceiling panels or lids above racks, and structural frames to create enclosed zones where cold supply air flows directly to IT equipment intakes. Without containment, cold supply and hot exhaust air mix throughout the data center. Data center operators seeking cost-effective cooling improvements are turning to cold aisle containment as the most retrofit-friendly solution for immediate efficiency gains. With typical cooling energy reductions of 20-35% and payback periods under three years, CAC systems offer the fastest path. At the core of rack cooling is the concept of “close-proximity cooling.” Through controlled airflow or liquid-cooled modules, the system directs the cooling medium precisely to the server’s heat-generating components, achieving localized, fast, and targeted heat exchange. Their benefit is measurable in enhanced uptime, productivity, and sustainability.
