

Corrosion protection measures for cable trays include

Overview

Common materials include: Stainless Steel: Highly resistant to corrosion, ideal for harsh environments. Corrosion can weaken cable trays, leading to failures that disrupt operations and pose safety risks. Without proper corrosion protection, the cost of repairs and replacements can be astronomical, and the safety of the entire electrical system can be compromised. The most commonly used options are: GI trays are made from pre-galvanized steel sheets. The National Electrical Manufacturers Association (NEMA) also publishes three consensus.
