

Data Center Energy Consumption Calculation

Overview

Estimate power density and cooling requirements for data center planning and cost control. data center annual energy use in 2023 (not accounting for cryptocurrency) was approximately 176 terawatt-hours (TWh), approximately 4. annual electricity consumption that year. Globally, data centers consumed approximately 460 TWh in 2022, representing about 2% of total worldwide electricity consumption. This paper presents methods for calculating power and cooling re-quirements and provides guidelines for determining the total. The Office of Management and Budget's (OMB's) Data Center Optimization Initiative (OMB memorandum M-16-19) outlines the energy efficiency requirements and strategies for federal data centers. The Federal Energy Management Program (FEMP) helps federal agencies meet these requirements.
