

Do transformer boxes use relay protection devices

Overview

Transformers are protected by fuses or circuit-interrupting devices such as breakers or circuit switchers with relays detecting faults and providing trip signals to the circuit-interrupting devices. Transformers 5 MVA and below are almost always protected by fuses. Transformer protection schemes include both electrical and mechanical protection devices: 1. Overcurrent Protection Protects against overloads and external short circuit faults: 2. Differential Protection (87) The most sensitive protection for internal transformer faults: Note: Differential. This guide focuses primarily on application of protective relays for the protection of power transformers. It is an enclosed static device usually drenched in oil, and hence, faults occurring in it are limited.
