

# Encapsulating optical modules

## Overview

This article explains the role of Potting/encapsulation across the full optical-module PCB lifecycle and how it balances high-speed signals, thermal power, and mechanical stress. Traditionally, Potting/encapsulation is viewed as mechanical support plus moisture/vibration. This topic describes the encapsulation types of optical modules on WDM products. Small form-factor pluggable (SFP) optical modules are compact, hot-swappable, low-speed optical modules. They comply with the specifications defined in the multi-source agreement (MSA) and support synchronous optical. As data centers rapidly move into the 800G and even 1.6T era, optical modules—the heart of the network—face unprecedented PCB design and manufacturing challenges. Whether you are creating a 100-Gbps or 400-Gbps, small form-factor pluggable (SFP) module, SFP+ transceiver, XFP module, CFP, X2/XENPAK module. As an essential component of optical fiber communication, optical modules are optoelectronic devices that facilitate the conversion between optical and electrical signals during the transmission process. · ROSA Structure ROSA structure according to its different applications and cost.
