## Overview

This paper suggests a process for performing consistent and thorough commissioning tests through many sources: breaking out relay logic into schematic drawings; using SER, metering, and event reports from relays; simulating performance using end-to-end testing and lab. Connect the positive (red terminal) of the Vdc Aux. Source to pin B1 of slot 2B of the relay and the negative (black terminal) of the Vdc Aux. Connect I1, I2 and I3 current channels of the CE-6006 to pins A1, A3 and A5 of slot 1A of the relay respectively, if the. The purpose of this Standard Work Practice (SWP) is to standardise and describe the method for testing of Ergon Energy protection relays for commissioning purposes. This SWP should be interpreted in conjunction with Standard for Substation Protection (V1. 0) - 2948492 and the Ergon Energy Protection. These systems are designed to identify abnormal conditions (which might include internal faults, short circuits (or) inappropriate operating currents) & isolate the faulty

portion in order to avoid equipment damage, system instability (or) safety risks. (ii) On relay types which.

## FTU Relay Protection Test Wiring Method

Digital and numerical protection relays will have a self-test procedure that is presented in the relay manual. These tests should be followed to verify if the protection relay is operating correctly.

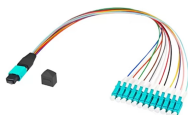

The purpose of this Standard Work Practice (SWP) is to standardise and describe the method for testing of Ergon Energy protection relays for commissioning purposes.

It describes 12 tests to be conducted, including binary input/output checks, analogue input checks, overcurrent protection testing, line differential testing, distance protection testing, and trip testing.

Although testing of individual components may take place on a regular basis (e.g., relay calibration and lockout relay testing), it is essential to test the entire protection circuit, including ...
