

Function of Low-Speed Optical Modules

Overview

Whether in 5G base stations, hyperscale data centers, or long-haul telecom networks, these modules convert electrical signals into optical ones — and back again — to ensure fast, stable, and energy-efficient communication. Definition Optical transceiver modules can be categorized by transmission rate into 100M, Gigabit, 10G, 40G, and 100G modules. Categories Currently, low-speed optical modules mainly come in. The Transmitter Optical Sub Assembly (TOSA) is responsible for the emission of light. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. The optical module, known as Optical Transceiver in English, is a general term for various module categories, including optical receiver modules, optical transmitter modules, optical transceiver modules, and optical forwarding modules. At the heart of every optical transceiver lie three essential components. This topic describes the encapsulation types of optical modules on WDM products Small form-factor pluggable (SFP) optical modules are compact, hot-swappable, low-speed optical modules.
