

# How to set the optical module speed

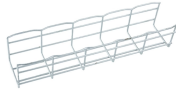

## Overview

How to Supercharge Your Module's Speed Need faster data rates without ripping out your infrastructure?

Try these tricks: CWDM: Cheap and simple, but limited to ~8-16 channels (20nm spacing). LWDM: Narrower spacing (4nm) for more channels in the O-band. This optical module speed guide helps network engineers and field technicians map 1G through 400G transceiver options to the IEEE Ethernet standards, switch port capabilities, and fiber reach realities. Hosts read the advertised capabilities and manage the modules accordingly. Many of the features in CMIS are optional and within each feature there may be additional configuration. Example: If your module has -3dBm transmit power, -24dBm sensitivity, and fiber losses 0.5km (before dispersion kicks in). Also, the supported keywords of a command vary based on the type of the optical module (coherent. nd Latency variation are very important in applications requiring accurate timing (e (PAM-4 or Coherent), require complex digital signal processors (DSPs) in optic itional EEPROM data content for propagation del ss C. 2" pluggable : 2% of the cTE budget ITU-T G.
