Overview

In April 1958, it awarded RCA a \$5 million contract in what became known as the Micromodule Program. Dummer of England's Telecommunications Research Establishment proposed "With the advent of the transistor and the work in semiconductors generally, it seems now possible to envisage electronic equipment in a solid block with no connecting wires. The first chips that could be considered microprocessors were designed and manufactured in the late 1960s and early 1970s, including the MP944 used in the Grumman F-14 CADC. Designers predominantly used MOSFET. The Model 726 was initially sold in 1953 with IBM's first electronic digital computer, the Model 701, and could store 2 million digits per tape—an enormous amount at the time. On November 5, 1971, Intel Corporation, a three-year-old start-up, announced the world's first "micro-programmable computer on a chip" - the 4004 microprocessor.

At the end of each year, a random Ranger Center will give you a free gift of one Micromodule. The module will be listed in your "Assets outside ship" permanent log message, until such time that you ...

Molecular electronics arose in the late 1950s as a visionary program conducted by Westinghouse on behalf of the Air Force. We attribute its failure to the difficulties inherent in matching ...

The first chips that could be considered microprocessors were designed and manufactured in the late 1960s and early 1970s, including the MP944 used in the Grumman F-14 CAD/C. Intel's 4004 of 1971 is widely regarded as the first commercial microprocessor. Designers predominantly used MOSFET transistors with pMOS logic in the early 1970s, switching to nMOS logic after the mid-1970s. Depletion-mode nMOS had the advantage that it could run on a single voltage...

The use of micro-modules makes possible no less than a tenfold reduction in size and weight of electronic devices. Tests indicate that the tiny cubes should be highly dependable, require ...

Micro-miniaturization is the latest refinement in the steady march toward electronic smallness touched off by the Bell Telephone Laboratories a decade ago with the development of the transistor.

In the 1940s, a micro-size electronic assembly might have included "peanut" vacuum tubes and even some sort of printed circuit board.

At Manchester University, Freddie Williams and Tom Kilburn develop the Williams-Kilburn tube. The tube, tested in 1947, was the first high-speed, entirely electronic memory. It used a cathode ray tube ...
