

# Interoperability between single-mode and multimode optical fibers

## Overview

Single-mode (SMF) and multi-mode fiber (MMF) use different core sizes, sources and wavelengths. These differences determine which transceivers work with which fiber and how far signals can travel. Understanding the compatibility constraints prevents costly downtime and. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones. Both technologies transmit data using light pulses through glass or plastic fibers, but their core design, performance characteristics. One confusing aspect around fiber optic cabling technology is the difference between Singlemode Fiber (SMF) and Multimode Fiber (MMF).
