

Optical Power Meters C-type and T-type

Overview

An optical power meter (OPM) is a device used to measure the power in an optical signal. The term usually refers to a device for testing average power in fiber optic systems. Other general purpose light power measuring devices are usually called radiometers, photometers, laser power meters (can be photodiode sensors or thermopile laser sensors), light meters or lux meters. A typical optic. SensorsThe major types are (Si), (Ge) and (InGaAs). Additionally. A typical OPM is linear from about 0 dBm (1 milli Watt) to about -50 dBm (10 nano Watt), although the display range may be larger. Above 0 dBm is considered "high power", and specially adapted units may measure u. Optical Power Meter and accuracy is a contentious issue. The accuracy of most primary reference standards (e.g., Length,, etc.) is known to a high accuracy, typically of the orde. A class of laboratory power meters has an extended sensitivity, of the order of -110 dBm. This is achieved by using a very small detector and lens combination, and also a mechanical light chopper at typically 270 Hz, so the. Optical power meters usually display time-averaged power. So for pulse measurements, the signal must be known to calculate the peak power value. However, the instantaneous peak power mus. • Measuring

the absolute power in a fiber optic signal. For this application, the power meter needs to be properly calibrated at the wavelength being tested, and set to this wavelength. • Measuring the optical loss in a fiber, in co.
