

POS type optical module

Overview

OSFP (Optical Small Form Factor Pluggable) is a standardized interface for high-speed optical communication, designed for optical modules with speeds of 400G and above. It offers higher data throughput and improved heat dissipation to accommodate faster transmission rates. These aggregation devices must simultaneously provide scalable bandwidth and interface density between the access and core networks; support numerous network protocols, as well as quality-of-service (QoS), security, and accounting features; and be compatible with the existing SONET infrastructure. Optical modules are a core component of optical fiber communication systems. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
