

Partition in the secondary distribution box

Overview

An electrical sub panel, also known as a sub distribution board or sub circuit breaker panel, is a smaller secondary panel connected to the main electrical panel in a building. It serves as an extension of the main electrical panel to distribute power to different areas or circuits. The Secondary Distribution Box (SDB) receives power from Main Power Distribution box via an extender cable and provides a central power distribution to feed normal branch circuits to the electric floor modules through snap-on extender cables. The SDB can be fitted with terminal blocks for custom. The installation comprises secondary distribution substation at the point of entry, with MV cables to supply subsidiary substations located near load centres.

General Low Voltage Equipment Packaged (Compact) Distribution Substations Low Voltage Distribution The space requirements of a substation depend on the equipment to be housed, and on whether a new building can be erected for it or it has to be fitted into an existing building. In the latter case it may be difficult to achieve an ideal solution, but where no severe limitations are imposed the layout in Figure 1 would prove satisfactory. This is s...
