

Relay Protection and Automatic Operation and Commissioning

Overview

Relays are the system's protective logic, responsible for fault detection and isolation. Testing confirms their accuracy, coordination, and compliance with IEEE C37. 90 and IEC 60255, ensuring faults are cleared quickly, and protecting equipment, while isolating the effect on. The testing and verification of protection devices and arrangements introduces a number of issues. Checking other design aspects such as the application configuration, including relay settings, and protection and control schemes, is also of the utmost importance. It categorizes the testing process into four stages: type tests, routine factory. In this training, we have used OMICRON Test universe, Vebko AMpro, and FREJA win.
