

Sequential power transmission in distribution network automation

Overview

Therefore, in order to enhance the economic and secure operation of the distribution network, this paper primarily studies active and reactive power scheduling considering the integration of distributed wind/solar power and EVs into the distribution network. A primary distribution substation is the connection point of a distribution system to a transmission or a sub-transmission network. In this context, it is of great practical interest to. Automating electrical distributions systems by implementing a supervisory control and data acquisition (SCADA) system is the one of the most cost-effective solutions for improving reliability, increasing utilization and cutting costs.
