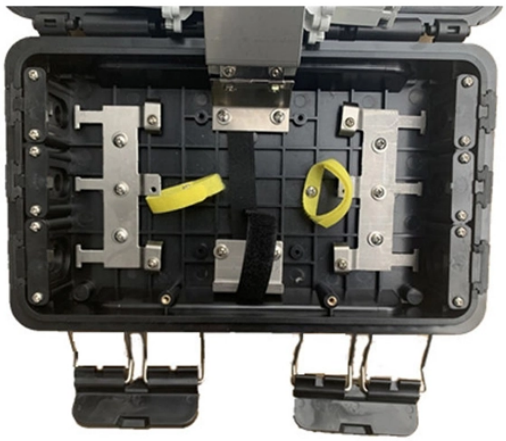
Switch Two-Port Aggregation



Switch Two-Port Aggregation

	MC-LAG (Multi-Chassis Link Aggregation Group) allows two switches to work together as a single logical unit, providing both load balancing and redundancy. This setup ensures minimal downtime by ...
	Link aggregation offers an inexpensive way to set up a high-capacity backbone network that transfers multiple times more data than any single port or device can deliver.
	Configuring port aggregation on a UniFi switch is straightforward using the UniFi Network Controller (or UniFi OS Console). The process involves selecting the ports you wish to combine, ...
	Discover the role of aggregation switches. Explore differences between aggregation, access, and core switches, and choose the right model for your network.
	Link aggregation, also known as port aggregation or NIC teaming, is a technique used in layer 2 and layer 3 network switches to combine multiple physical links into a single logical link.

In Ethernet port aggregation, multiple physical ports on a switch are grouped together to form a single logical port. This logical port acts as a single ...

In Ethernet port aggregation, multiple physical ports on a switch are grouped together to form a single logical port. This logical port acts as a single high-bandwidth link, providing increased ...

Port aggregation is useful for implementing load balancing and provides a redundant link backup. To allow port aggregation, the basic configuration on all the ports must be consistent. The following list ...

Link Aggregation in UniFi allows you to combine two or more ethernet ports into one. This is great when you want to increase the throughput between two switches or need to connect a client ...

You can configure LAGs to connect a QFX Series product or an EX4600 switch to other switches, like aggregation switches, servers, or routers. This example describes how to configure LAGs to connect ...
