

What is the relationship between optical modules and modules

Overview

In high-speed optical communication, optical modules are traditionally packaged as separate devices where optical chips (lasers, modulators, photodetectors) and electronic chips (drivers, TIAs, DSPs) are integrated into a module housing. Operating at the physical layer of the OSI model, optical modules are core devices in optical. Optical modules are compact devices that convert electrical signals into optical signals and vice versa. These modules typically consist of a laser or LED transmitter, a. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its fundamental role is to bridge the gap between electrical equipment and optical fibers.
