

Which pigtail fiber emits light and which receives it

Overview

Core and Cladding: The body is the thin glass center of the fiber where the light propagates. Their combined structure enables total internal reflection, allowing light to travel down the fiber. A Fiber Pigtail is a single, short, usually tight-buffered, optical fiber that has an optical connector pre-installed on one end and a length of exposed fiber at the other end. This sensitive end is fusion spliced onto another single fiber (or fiber bundle), providing a robust and reliable link. Executive Summary: A fiber optic pigtail is one of the most commonly specified yet least understood components in structured cabling.
