

## Why is an extra 200 added for fiber optic cable

### Overview

Longer runs increase cable, labor, and potentially trenching costs; outdoor deployments add conduit, backfill, and permitting complexity. The excess is called a service loop and also called service slack, and we will use the terms interchangeably. Note that fiber optic cable and coaxial cable will typically follow similar rules for excess cable. We always recommend using APC (angled physical contact) connectors on short SM links. FOA tries to stick to the definition that. Plus, AT&T's fiber internet prices already include equipment rental, which most providers hide or try to tack on after the fact. Commercial building installations with 100-200 network drops generally range from \$15,000 to \$30,000.
